plants to Lepidoptera, as a guide for conservation. The compilation was based on Lepidoptera species listed in Goater (1974), but excluding species with fewer than five specimens recorded and non-breeding migrant species. Food plants were listed from my experience and the literature: Scorer (1913), Stokoe (1948), Allan (1949), Emmet (1988) and Emmet and Heath (1979 & 1983). Top of the list for host trees were *S. caprea* (goat willow) and *Quercus* spp. (deciduous oaks), with 180 species each, followed by *Betula* spp. (birch) 175, and *Crataegus* spp. (hawthorns) 150. – A.H. DOBSON, 282 Britten Road, Basingstoke RG22 4HR.

Holcostethus vernalis (Wolff) (Hem.: Pentatomidae) and Bathysolen nubilis (Fallén) (Hem.: Coreidae) in Hampshire. – On 29 May 2007, I swept an adult male H.vernalis from a rough grassy glade in an abandoned orchard in Lock's Heath, South Hampshire (VC11) (SU5006). This appears to be the first record of this species in Hampshire (Bernard Nau, pers. comm.), and my second coming after another single male from the former Ore Power Station, Hastings, East Sussex (TQ8210) on 22 September 2003.

On 4 June 2007, I visited part of the old Royal Aircraft Establishment at Farnborough, North Hampshire (VC12) (SU8654), where a large area of black medick *Medicago lupulina* had developed on foundations of a building demolished in 2002. Having found *B. nubilus* in similar places in Essex and Kent in recent years, I was unsurprised to find adults under the first rosette examined. These appear to be the first seen in Hampshire, and a westerly extension to its known range, lying some 35km from Surbiton, where I found it new for Surrey in 1998.
